COMPUTER SCIENCE

Chair, Professor Bruce Maxwell
Professors Dale Skrien and Bruce Maxwell; Associate Professor Stephanie Taylor; Assistant Professors Caitrin Eaton and Ying Li; Visiting Assistant Professor Zadia Codabux

Computer science studies the design of computational processes, computing systems, and virtual objects. Our goal is to provide students with a strong background in computer science, including the integration of knowledge from other disciplines. Our graduates have the ability and experience to enable and to produce innovative discoveries.

Students with a variety of interests may want to explore computer science, as it affects and interacts with virtually every discipline. Many advances in the natural and social sciences, engineering, and the humanities would not have been possible without the exponential growth in computing power and the corresponding design of advanced algorithms by computer scientists. Students who become majors or minors, or take just a few courses, will extend their potential by knowing more about how to effectively use computers and computation.

Students in computer science courses learn primarily through programming projects that provide them with experience in design, the application of computational thinking, and problem solving. Computational thinking is the ability to deconstruct a problem or process and describe it at the level of computable operations. Computational thinking integrates abstraction, hierarchical design, information management, and an understanding of complexity. The projects students undertake increase in scope and complexity both within a single course and as students progress through the major.

The computer science major prepares students for graduate work in computer science and related areas and for a wide variety of careers. The computer science minor provides students with the ability to effectively apply computational thinking to other disciplines. The interdisciplinary computation majors in biology, environmental studies, music, or theater and dance give students the opportunity to integrate computer science with a focus discipline. Students interested in any of these programs should enroll in Computer Science 151 or 152 in their first year.

Requirements for the Major in Computer Science

Computer Science 151 or 152, 231, 232, 251, 333, and 375 or 378; one elective numbered 200 or above; two electives numbered 300 or above; one elective numbered 400 or above; and one 200-level mathematics or statistics course. Students may count only Computer Science 151 or 152, 231, and 251 toward both the computer science major and any interdisciplinary computation major.

Requirements for the Honors Program in Computer Science

An honors program is available for students who wish to pursue a topic more deeply. Students must have a grade point average of at least 3.6 in all computer science courses numbered 200 or higher and complete a yearlong, preapproved honors project (Computer Science 483 and 484) of at least seven credits, culminating in both a written paper and a colloquium presentation. Four credits of the honors project satisfy an elective in the major requirements. Students who successfully complete the requirements and receive the recommendation of the department will graduate with “Honors in Computer Science.”

Requirements for the Minor in Computer Science

One Computer Science course numbered 150 or above, 231, 251, one course numbered 200 or above, one course numbered 300 or above, and a capstone experience. The capstone experience can be either (a) a course numbered 400 or above, or (b) a four- (or more) credit independent study with a significant computing component in the student’s major department. Option (b) must be preapproved by a computer science advisor.

The point scale for retention of the major/minor applies to all courses in the major/minor. No requirement for the major/minor may be taken satisfactory/unsatisfactory.

A minor in data science is described in the “Data Science” section of the catalogue.

Requirements for the Majors in Interdisciplinary Computation

Listed under “Biology” (as Computational Biology), “Environmental Studies,” “Music,” and “Theater and Dance.”

Course Offerings

CS151fs  Computational Thinking: Visual Media  An introduction to computational thinking: how we can describe and solve problems using a computer. Using the Python language, students will learn how to write algorithms, manipulate information, and design programs. They will learn about abstraction, how to divide and organize a process into appropriate components, how to describe processes in a
computer language, and how to analyze and understand the behavior of their programs. The projects will focus on manipulating images or generating complex and interesting scenes and animations each week through writing well-constructed programs.  

**Q. EATON, SKRIEN**

**CS152fs  Computational Thinking: Science** An introduction to computational thinking: how we can describe and solve problems using a computer. Using the Python language, students will learn how to write algorithms, manipulate information, and design programs. They will learn about abstraction, how to divide and organize a process into appropriate components, how to describe processes in a computer language, and how to analyze and understand the behavior of their programs. The projects focus on: (1) reading, writing, managing, and analyzing data; (2) modeling ecological systems using population and agent-based approaches; and (3) simulating physical systems with gravity and collisions.  

**Four credit hours. Q. CODABUX, SKRIEN**

**CS231fs  Data Structures and Algorithms** Focuses on the common structures used to store data and the standard algorithms for manipulating them. Standard data structures include lists, stacks, queues, trees, heaps, hash tables, and graphs. Standard algorithms include searching, sorting, and traversals. Along with implementation details, students will learn to analyze the time and space efficiency of algorithms and how to select appropriate data structures and algorithms for a specific application. In homework, labs, and programming projects, students will implement their own data structures and make use of existing libraries to solve a variety of computational problems.  

**Prerequisite:** A grade of C- or higher in Computer Science 151 or 152.  

**Four credit hours. Q. CODABUX, LI, TAYLOR**

**CS232f  Computer Organization** Computer organization focuses on how computers work. Students learn the fundamental hardware components, including storage (RAM, hard disks), input/output mechanisms, and the central processing unit (CPU). They learn how components are designed and built on several levels, including the design of electrical components, machine language, and assembly language. They also learn to program in assembly language for one or more simple processors. Students learn primarily through projects where they design digital circuits, design components of a CPU, or write programs in assembly language.  

**Prerequisite:** Computer Science 231.  

**Four credit hours. LI**

**CS251s  Data Analysis and Visualization** Prepares students to apply computational data analysis and visualization approaches to real information from a variety of disciplines and applications. Data visualization is the interactive visual exploration of 2-D and 3-D graphic information using techniques that highlight patterns and relationships. Data analysis incorporates data management, data transformations, statistical analysis, data mining, and machine learning. Through programming projects, students will gain hands-on experience with the fundamentals of data analysis and visualization using data from active research projects at Colby and other institutions.  

**Prerequisite:** Computer Science 231. Mathematics 253 required for section B only.  

**Four credit hours. EATON, TAYLOR**

**[CS267] Interactive Digital Media** Digital forms of text, sound, images, and video enable rapid communication and manipulation of large amounts of information. Digital sensors provide easy access to information about the environment. Connecting sensors with digital media enables the creation of artistic installations with dynamic narratives that respond to a user's actions. Students will learn to manipulate digital media and collect sensor data using both applications and their own computer programs. By combining the two, they will create their own artistic installation and demonstrate it at the end of the term.  

**Prerequisite:** Computer Science 151, 152, or 231.  

**Four credit hours. A.**

**[CS269] Computer Game Design** Focuses on the process of taking stories, situations, puzzles, or challenges and defining them so a computer can execute the construct within which the game resides. Students will design a 2-D computer game using a standard game engine. Topics include game design, artistic concepts, image manipulation, game scripting, and artificial intelligence. Students will work in groups to design and develop a 2-D game to be distributed at the end of the term. Each group will make weekly presentations to the class, demonstrating their progress in game design.  

**Prerequisite:** Computer Science 151 or 152.  

**Three credit hours.**

**[CS321] Computer Networks and Security** An introduction to key concepts in computer and data networking from both operational and security perspectives. Topics include data networking protocols, common network architectures, the Internet, computer and network threats, and applied network and system security. Topics will be applied and compared to real-world examples that help form perspectives on the modern networked world, its history and future, and its broader role in the information age. Students will engage the material through programming projects and written assignments.  

**Prerequisite:** Computer Science 231.  

**Four credit hours.**

**CS325j  Web Programming** The art and science of building dynamic (interactive) websites. Students will learn the fundamentals of the Internet and its HTTP/TCP/IP protocols, HTML and CSS, and how to use them to create well-designed web pages that follow industry standards. They will learn to program in JavaScript to create client-side dynamic web pages, in PHP or another language to create server-side dynamic web pages, and in SQL to create, access, and modify a relational database. Finally, they will learn about XML, DOM, and AJAX, and how to use them to add Web 2.0 features to web pages.  

**Prerequisite:** Computer Science 231.  

**Three credit hours.**

**SKRIEN**

**[CS331] Computer Networks** An introduction to fundamental concepts of computer networks and widely used networking technologies. Topics include application protocol design; principles of congestion and error control protocols; network routing; local, wireless, and access

Undecidability. Languages discussed include regular languages, context-free languages, and recursively enumerable languages. Both parallel and distributed algorithms will be discussed. Students will learn through problem sets and short programming projects.

CS375s Analysis of Algorithms Focuses on classical algorithms in computer science and the analysis of the space and time efficiency of such algorithms as those that sort arrays and lists and search various data structures, including lists, trees, graphs, and strings. All major categories of algorithms are discussed, including iteration, divide and conquer, brute force, exhaustive search, greedy, dynamic programming, and approximation. Unsolvable and intractable problems are also covered, as is the role of NP-completeness. If time permits, some parallel and distributed algorithms will be discussed. Students will learn through problem sets and short programming projects. Prerequisite: Computer Science 231. Four credit hours. SKRIEN

CS378f Introduction to the Theory of Computation Focuses on formal languages, automata, computability, complexity classes, and undecidability. Languages discussed include regular languages, context-free languages, and recursively enumerable languages. Both
deterministic and non-deterministic forms of the corresponding machines (finite automata, push-down automata, and Turing machines) are also discussed. Unsolvable and intractable problems are addressed, as is the role of NP-completeness. Students will learn through problem sets and short programming projects. Prerequisite: Computer Science 231 and either Mathematics 274 or 275. Four credit hours.

SKRIEN

CS397f  Software Engineering I  An introduction to the concepts of software engineering. Starts with development life cycle models, such as agile development, and then continues to cover project planning, requirements specification, object-oriented analysis and design, software testing techniques, software maintenance, and configuration management. Students will learn these concepts by working in teams to apply them to real-world software design problems and develop software applications. Prerequisite: Computer Science 231. Four credit hours.  CODABUX

[CS431]  Advanced Computer Networks  Students will learn the fundamental concepts of wireless sensor networks, study current research in depth, and explore novel ideas in this area. In the first stage, students will read papers, learn commonly used networking tools, and write reports. In the second stage, they will work in groups to propose, research, write, and orally present a standard IEEE/ACM conference paper. Prerequisite: Computer Science 331. Four credit hours.

CS441s  Systems Biology II  The application of principles learned in Systems Biology I to a particular biological system. Students will work in interdisciplinary teams to complete a project focusing on one biological system and one or more mathematical models of this system. Involves reading journal articles, designing and running numerical experiments, analyzing results, and presenting challenges and results. Culminates in both a poster presentation and a comprehensive journal article-styled report and oral presentation. Prerequisite: Computer Science 341. Four credit hours.  N. TAYLOR

[CS451]  Advanced Computer Graphics  Focuses on advanced algorithms for rendering both hyper-photorealistic and non-photorealistic images of objects and scenes. Topics will include ray tracing, radiosity and other global illumination methods, animation, motion capture and mapping, modeling unique materials, modeling painting and drawing techniques, and other topics selected by students. Each week students will prepare written summaries and critiques of technical papers in computer graphics. Programming projects will include OpenGL, a photorealistic project, a non-photorealistic project, and a final project of the student's choice. Prerequisite: Computer Science 351. Four credit hours.

[CS461]  Object-Oriented Software Systems  Students will learn how to design and implement a significant software project that is robust, maintainable, extensible, and modular, building on their experience in Computer Science 361. The focus will vary from year to year. For example, students may gather specifications and then analyze, design, and implement a business application or dynamic website following standard software engineering practices. Students will learn through creating, implementing, and refining their own software designs in an iterative design process. Prerequisite: Computer Science 361 (may be taken concurrently) and 361. Four credit hours.

CS481f, 482s  Minor Capstone  Independent project and capstone experience for minors. Taken in tandem with a course in the student's major to develop a computing project in consultation with his or her computer science advisor that relates to or extends a topic from the related course. Two to four credit hours.  FACULTY

MAXWELL  FACULTY

CS491f, 492s  Independent Study  Independent study in an area of computer science of particular interest to the student. Prerequisite: Permission of the instructor. One to four credit hours.  FACULTY

CS498s  Software Engineering II  Students will apply the concepts and techniques studied in Software Engineering I to a software project. Students will capture and analyze requirements and design, implement, and test an application following software engineering best practices. Students will learn how to continuously improve their software through maintenance activities such as program comprehension and re-engineering and will be exposed to some of the latest research in software engineering. Prerequisite: Computer Science 397. Four credit hours.  CODABUX
