The Department of Mathematics and Statistics offers courses for students who: (1) plan a career in an area of pure or applied mathematics, including statistics; (2) need mathematics as support for their chosen major; or (3) elect to take mathematics as part of their liberal arts education or to fulfill the area requirement in quantitative reasoning.

The department offers majors in mathematics and in mathematical sciences as well as minors in mathematics and in statistics. The major in mathematical sciences is also offered with a concentration in statistics. Majors in mathematics and in mathematical sciences can be taken with honors.

Colby mathematics majors in recent years have entered graduate school to do advanced work in mathematics, statistics, biostatistics, engineering, economics, computer science, biomathematics, and the sciences. They also have used the major as a solid foundation for careers in teaching, law, medicine, banking, insurance, management, the computer industry, and other areas.

All incoming students who intend to enroll in mathematics courses in the fall semester are required to complete the mathematics placement questionnaire prior to registration.

Requirements for the Major in Mathematics

Completion of each of the following with a grade of C- or higher: one year of calculus; Mathematics 253, 274, 333, 338, and either 434 or 439; four additional courses selected from Mathematics 262 and any three- or four-credit mathematics courses numbered 300 or above (excluding 484). In exceptional cases, with the permission of the department, another 400-level course may be substituted for 434 or 439.

The department recommends that students complete Mathematics 274 or 275 before the end of their sophomore year. Although Mathematics 262 and 352 are not specifically required, the department strongly recommends that mathematics majors complete both courses.

Requirements for the Major in Mathematical Sciences

Completion of each of the following with a grade of C- or better: Mathematics 122 or 162, 253, 274, 311; one three- or four-credit course from Computer Science; four additional three- or four-credit courses selected from mathematics or statistics courses numbered 200 or above; one "Topics" course in Mathematics or Statistics numbered 400 or above (excluding 484). The department recommends that Mathematics 274 be completed before the end of the sophomore year.

Requirements for the Major in Mathematical Sciences with a Concentration in Statistics

Completion of each of the following with a grade of C- or better: Mathematics 122 or 162, 253, 274, 311, 381; one three- or four-credit course from Computer Science; Statistics 212, 321, one additional Statistics course numbered 300 or above (excluding 484), and Statistics 482. The department recommends that Mathematics 274 be completed before the end of the sophomore year. Students considering graduate school in statistics are strongly encouraged to take Mathematics 338.

Requirements for the Honors Program in Mathematics or Mathematical Sciences

An honors program is available for students majoring in mathematics and mathematical sciences who have a grade point average of at least 3.25 in all mathematics and statistics courses numbered 200 or higher and who complete an additional, preapproved program of independent study in the major (Mathematics 484 or Statistics 484) culminating in both a written paper and a colloquium presentation. Students who successfully complete the requirements and who receive recommendation of the department will graduate with “Honors in Mathematics” or with “Honors in Mathematical Sciences.”

Requirements for the Minor in Mathematics

Six three- or four-credit mathematics courses numbered 121 or above, including Mathematics 122 or 162, Mathematics 253, and at least one course at the 300 level or above. Statistics 212 may substitute for one of the elective mathematics courses.

A minor in data science is described in the “Data Science” section of the catalogue.

A minor in statistics is described in the “Statistics” section of the catalogue.
The point scale for retention of the majors and minor applies to all courses in the majors/minor. No requirement for the majors or minor may be taken satisfactory/unsatisfactory.

Course Offerings

MA101f  Calculus with Pre-calculus I  Designed for students who enter Colby with insufficient algebra and pre-calculus background for the standard calculus sequence. It is expected that all students who complete Mathematics 101 will enroll in Mathematics 102 in the following January. The combination of 101 and 102 covers the same calculus material as Mathematics 121. Completion of 101 alone does not constitute completion of a College calculus course for any purpose; in particular, it does not qualify a student to take Mathematics 122 nor does it satisfy the quantitative reasoning requirement. Three credit hours. MOURNING-STAR

MA102f  Calculus with Pre-Calculus II  A continuation of Mathematics 101. Successful completion of both Mathematics 101 and 102 is equivalent to completion of Mathematics 121. Prerequisite: Mathematics 101. Three credit hours. Q. MOURNING-STAR

[MA111]  Mathematics as a Liberal Art  Four credit hours. Q.

MA121fs  Single-Variable Calculus  Calculus is the result of centuries of intellectual effort to understand and quantify change, such as the position of a moving object or the shape of a curve. Competent users of calculus understand its intellectual structure sufficiently to apply its ideas to a variety of intellectual pursuits. Topics include differential and integral calculus of one variable: limits and continuity; differentiation and its applications, antiderivatives, the definite integral and its applications; exponential, logarithmic, and trigonometric functions. Prerequisite: New first-year students must complete the mathematics placement questionnaire found at www.colby.edu/math/newstudent. Four credit hours. Q. FACULTY

MA122fs  Series and Multi-variable Calculus  A continuation of Mathematics 121. Students will learn how to use infinite series, both to represent and to approximate functions, and will extend all of their skills from single-variable calculus to the multivariable setting. Topics: infinite series; vectors and analytic geometry in two and three dimensions; partial derivatives, differentials and the gradient; integration in two and three variables. Prerequisite: A course in single-variable calculus. New first-year students must complete the mathematics placement questionnaire found at www.colby.edu/math/newstudent. Four credit hours. Q. ABDELGHANY, GOUVEA, RANDLES, YOUNGS

MA161f  Honors Calculus I  The first in a two-course sequence that treats the material of Mathematics 121 and 122 with a focus on the intellectual structure behind the methods. Students will acquire a deep understanding of the theory and foundational facts of calculus, will be able to use the techniques in an intelligent manner, will understand and be able to explain the arguments that undergird those techniques, and will be able to construct original arguments of their own. Topics are presented as a deductive mathematical theory, with emphasis on concepts, theorems, and their proofs. May not be taken for credit if the student has earned credit for Mathematics 122. Prerequisite: One year of calculus in high school. New first-year students must complete the mathematics placement questionnaire found at www.colby.edu/math/newstudent. Four credit hours. Q. LIVSHITS

MA162s  Honors Calculus II  A continuation of Mathematics 161. Topics are essentially the same as for Mathematics 122, but they are presented as a deductive mathematical theory, with emphasis on concepts, theorems, and their proofs. Student who receive an A- or above will receive an exemption from taking MA274. May not be taken for credit if the student has earned credit for Mathematics 122. Prerequisite: Mathematics 161. Four credit hours. Q. LIVSHITS

MA253fs  Linear Algebra  Linear algebra is a crossroads where many important areas of mathematics meet, and it is the tool used to analyze the first approximation of complex systems. Students will learn to understand and use the language and theorems in both abstract and applied situations, gain insight into the nature of mathematical inquiry, and learn how to reason carefully and precisely about formally described situations. Topics include vectors and subspaces in $\mathbb{R}^n$, linear transformations, and matrices; systems of linear equations; abstract vector spaces and the theory of single linear transformation: change of basis, determinants, eigenvalues and eigenvectors, and diagonalization. Prerequisite: Mathematics 122 or 162; or Mathematics 102, 121, or 161 with permission of the instructor. Four credit hours. FRIEDMANN, GOUVEA, LIVSHITS

MA262s  Vector Calculus  Develops ideas first seen in Mathematics 122 by applying the notions of derivative and integral to multi-variable vector-valued functions. The goal is to understand the high-dimensional versions of the fundamental theorem of calculus and to use these theorems in specific scientific applications. Topics include parameterized curves and surfaces; gradient, divergence, and curl; change of variables and the Jacobian; line and surface integrals; conservative vector fields; Green's, Stokes's, and Gauss's theorems; applications. Prerequisite: Mathematics 122 or 162. Four credit hours. TAYLOR, WELCH

MA274fs  Mathematical Reasoning  Proofs are the main method used by mathematicians to develop and communicate their ideas; this
course prepares students to read, create, write, and communicate mathematical arguments. Topics include logic and standard methods of
direct and indirect proof; the set-theoretic approach to functions and relations; the theory of infinite sets; elementary algebraic structures;
and techniques from discrete mathematics. Credit can be received for only one of Mathematics 274 and 275. **Prerequisite:** Mathematics
102, 121, 122, or 161, and a W1 course. Two semesters of calculus is recommended. **Four credit hours.**

**MA311s** **Ordinary Differential Equations** Differential equations allow us to deduce the long-term behavior of quantities from information
about their short-term rates of change; for that reason they are the language of classical science. Students will learn to analyze concrete
situations modeled by differential equations and to draw conclusions using equations, graphical techniques, and numerical methods. Topics
include theory and solution methods of ordinary differential equations, linear differential equations, first-order linear systems, qualitative
behavior of solutions, nonlinear dynamics, existence and uniqueness of solutions, and applications. **Prerequisite:** Mathematics 122 or 162,
and 253. **Four credit hours.**

**MA314** **Geometry of Surfaces** Explores the notion of "geometry" by studying the most important two-dimensional geometries:
Euclidean, spherical, and hyperbolic. We will prove that every compact two-dimensional surface admits a geometric structure modeled on
one of these geometries. As time allows we will also study applications of these geometries and their relationship to Teichmüller space,
Kleinian groups, and three-dimensional manifolds. Students will engage in significant self-teaching and will communicate mathematical
ideas with oral presentations, written proofs, and short essays aimed at a general audience. **Prerequisite:** Mathematics 162 or 262; 253;
and 274 or 275. **Four credit hours.**

**MA331** **Topology** Begins as the abstract mathematical study of the notions of proximity and continuity and then deploys these methods
to understand interesting objects and spaces. Students will develop their ability to construct precise arguments and to explore concrete
examples as instances of a general theory. Topics are selected at the discretion of the instructor from the areas of point-set, differential, and
algebraic topology. **Prerequisite:** Mathematics 274 or 275. **Four credit hours.**

**MA332** **Numerical Analysis** In practice, a solution to a problem might be impossible to obtain by classical methods of manipulating
equations. Nonetheless, solutions can often be obtained by numerical methods, usually with the aid of a computer. Numerical analysis is the
study of those numerical algorithms. Students will acquire the ability to use standard methods and mathematical software for solving the
most common types of numerical problems and to analyze the speed and accuracy of the solutions. Topics include solution by numerical
methods of linear and nonlinear equations, systems of equations, and differential equations; numerical integration; polynomial
approximation; matrix inversion; error analysis. **Prerequisite:** Mathematics 122 or 162, and 253; 274 is recommended. **Four credit hours.**

**MA333f** **Abstract Algebra** Simply called "algebra" by mathematicians, it is the study of abstract sets with operations and is fundamental
in expressing and working in theoretical mathematics. An introduction to that language, to the motivating examples, and to some of the
fundamental theorems. Students will develop their ability to discover and write formal arguments, explore the relationship between general
theory and specific examples, and learn to recognize algebraic structures where they occur. Topics include groups, rings, and fields:
definition, basic theorems, and important examples. **Prerequisite:** Mathematics 253, and 274 or 275. **Four credit hours.**

**MA335f** **Mathematical Neuroscience** Neuroscience is an expanding and dynamic field, seeking to understand the complexities of the
brain. Recent advances in technology have improved our ability to record brain activity, and with this comes the need for new and improved
models to understand this influx of information. In this course, students will work with theoretical mathematical models of the brain on
different scales, from the cellular and single-neuron level up to interactions between brain regions, using both discrete and continuous
techniques. **Prerequisite:** Mathematics 122 or 162, and 253. **Four credit hours.**

**MA336** **Mathematical Economics** Listed as Economics 336. **Four credit hours.**

**MA338s** **Real Analysis** An exploration of the theory behind calculus, as well as its extension to more general settings. Students will learn
to think carefully and clearly about limiting processes such as differentiation, integration, and summation of series and to interpret their
knowledge in terms of the topology of metric spaces. They will develop the ability to read and to produce formal mathematical arguments,
with particular attention to handling exceptional cases and delicate issues of convergence. Special focus on foundational issues: topology of
metric spaces, continuity, differentiation, integration, infinite series. **Prerequisite:** Mathematics 122 or 162, and 274 or 275. **Four credit
hours.**

**MA352** **Complex Analysis** An introduction to functions of a complex variable. Topics include the definition and properties of
holomorphic and analytic functions, Cauchy's integral theorem and formula, meromorphic functions, representation by Laurent series, the
residue calculus, and the elementary transcendental functions. Offered in alternate years. **Prerequisite:** Mathematics 122 or 162, and 274
or 275. **Four credit hours.**
MA353s  Advanced Linear Algebra  Continues the exploration of linear algebra initiated in Mathematics 253. The emphasis is on the
topics of matrices, linear spaces, and linear transformations, investigating them more deeply. Topics will come from the following list:
canonical forms, factorizations, spectral theory, matrix functions and equations, and multilinear algebra. Applications of the theory will also
be considered. Prerequisite: Mathematics 253 and 274, or equivalent.  Four credit hours.  LIVSHITS

MA355s  Combinatorics  Combinatorics can be thought of as the study of counting things. Topics to be covered in this course include
basic counting principles, recurrence relations, graphs and trees, distributions and partitions, generating functions, inclusion/exclusion, and
permutations. Prerequisite: Mathematics 274.  Four credit hours.  FRIEDMANN

[MA357]  Elementary Number Theory  Number theory deals with questions about numbers, especially those related to prime numbers
and integral and rational solutions of equations. The subject offers a wide array of problems that are easily stated and understood but that
can be difficult to solve. Students will gain an understanding of the beauty that such problems offer as well as the persistence that is often
necessary in tackling them, and they will strengthen their program-solving and proof writing skills. Topics may include prime numbers and
unique factorization; Diophantine equations; congruences; Fermat's Little Theorem, the Chinese Remainder Theorem, and RSA
cryptography; quadratic residues, reciprocity. Prerequisite: Mathematics 274.  Four credit hours.

MA376f  History of Mathematics  The history of mathematics with emphasis on the interaction between mathematics, culture, and
society. Writing-intensive and involving careful reading of original historical documents. By studying the mathematics of different times and
cultures, students will deepen their own understanding of mathematics and develop a clearer idea of how society and mathematics influence
each other. A survey of the history of mathematics is followed by a more careful tracing of the development of one theme or topic. Specific
topics vary from year to year but often include the mathematics of non-Western cultures. Prerequisite: Mathematics 274 or 275.  Four
credit hours.  H.  GOUVEA

MA378s  Introduction to the Theory of Computation  Listed as Computer Science 378.  Four credit hours.  AARON

MA381s  Probability  A mathematical introduction to probability theory, the foundation for commonly used inferential statistical
techniques (covered in Statistics 482). Students will learn the basic theorems of probability and computational techniques for finding
probabilities associated with stochastic processes. Topics include axiomatic foundations, combinatorics, random variables, discrete and
continuous probability distributions, special probability distributions, independence, conditional and marginal probability distributions,
properties of expectations, moment generating functions, sampling distributions, weak and strong laws of large numbers, and the central
limit theorem. Prerequisite: Mathematics 122 or 162; 274 is recommended.  Four credit hours.  BONTEA, O'BRIEN

MA397f  Geometry and Topology of Knots  The mathematics of knot theory is strongly connected to many different mathematical and
scientific disciplines. This course provides an introduction to knot theory, emphasizing its combinatorial, topological, and geometric aspects.
Along the way, we'll learn foundational concepts from geometry, topology, and algebra and see the relevance to certain problems in
biology, chemistry, and physics. The course will emphasize the process of posing creative questions about mathematical objects and
turning intuitive ideas into precise, mathematical ones. Coursework will involve reading carefully selected journal articles, solving
mathematics problems, writing solutions, and pursuing and presenting targeted research projects. Prerequisite: Mathematics 274.  Four
credit hours.  TAYLOR

MA411s  Topics in Differential Equations  A sequel to Mathematics 311, with higher-level content and a more extensive study of
differential equations. Students will implement advanced analytical methods, examine theory, and demonstrate an understanding of further
applications. Topics will vary from year to year. May be repeated for credit with permission of instructor. Prerequisite: Mathematics 122 or
162, and 253, and 311.  Four credit hours.  RANDLES

MA434s  Topics in Abstract Algebra  One semester's exposure to algebra is not sufficient for further work in mathematics, so this is a
continuation of Mathematics 333. Students will further develop their ability to speak the language of and use the methods of algebra through
the study of one particular algebraic theory. Improving one's written and oral communication of mathematics is an integral part of the course.
Topics will vary from year to year. May be repeated for credit with permission of instructor. Prerequisite: Mathematics 333.  Four credit
hours.  YOUNGS
MA439f   Topics in Real Analysis  A sequel to Mathematics 338. Students will deepen their understanding of analysis through the exploration of more-advanced topics and will sharpen their ability to read, analyze, construct, and present proofs. Improving one's written and oral communication of mathematics is an integral part of the course. Topics will vary from year to year. May be repeated for credit with permission of instructor.  Prerequisite:  Mathematics 338.  Four credit hours.  MATHES

[MA472]   Topics in Mathematical Modeling  Mathematical modeling provides a means to explain and predict phenomena. Applications are numerous, especially in the physical and social sciences. Students will learn to correctly interpret existing models and create new ones and will develop an understanding of the purpose and uses of mathematical models. The emphasis will be on analyzing research publications and on producing research-level mathematical models. Writing and discussion will be important components. Computers will be used for analysis and simulation. Topics will vary from year to year. May be repeated for credit with permission of instructor.  Prerequisite:  Mathematics 122 or 162, and 253, and 311.  Four credit hours.

MA482s   Topics in Statistical Inference  Listed as Statistics 482.  Four credit hours.  ZELDOW

MA484s   Honors Project  The independent study component of the honors program in mathematics. Cannot be counted toward the major or minor.  Prerequisite:  Permission of the instructor and admission to the honors program.  Three or four credit hours.  FACULTY

MA484s   Honors Project  The independent study component of the honors program in mathematics. Cannot be counted toward the major or minor.  Prerequisite:  Permission of the instructor and admission to the honors program.  Three or four credit hours.

MA491f, 492s   Independent Study  Independent study in an area of mathematics of particular interest to the student.  Prerequisite:  Permission of the instructor.  One to four credit hours.  FACULTY
